TWENTY-FIRST REPORT

OF THE

BOARD OF SUPERINTENDENCE OF THE DUBLIN HOSPITALS.

TO HIS GRACE THE DUKE OF MARLBOROUGH, K.G.,
Lord Lieutenant-General and General Governor of Ireland,
do., do., do.

2nd December, 1879.

MAY IT PLEASE YOUR GRACE,

We, the Board of Superintendence of the City of Dublin Hospitals, submit to your Grace this our Twenty-first Annual Report, under statute 19 & 20 Vict. cap. 110 entitled "The Dublin Hospitals Regulation Act."

During the year ended 31st March, 1879, we inspected the following hospitals which receive grants from Parliament:

These are:—

1. Westmorland Lock Hospital.
2. The House of Industry Hospitals, viz.:—
 - a. Hardwicke Fever Hospital.
 - b. Whitworth Medical Hospital.
 - c. Richmond Surgical Hospital.
3. Steevens's Hospital.
4. Meath Hospital and County Dublin Infirmary.
5. Cork-street Fever Hospital.
6. Rotunda Lying-in Hospital.
7. Coombe Lying-in Hospital.
8. St. Mark's Ophthalmic Hospital; and
9. Hospital for Incurables, which receives a portion of the Concordatum Fund.

On the occasion of our visits, the officers or governors gave their personal attendance, and in every way furnished information and facilitated inquiry.

We carefully examined the wards and other parts of the buildings to ascertain their condition, and the care and attention bestowed on the patients.

On the 1st April, 1878, there remained 928 patients in these hospitals; the number admitted during the year was 12,552, making the total under treatment 13,480, of whom 12,332 left the wards cured, relieved, or were dismissed for other causes,

including 1,025 who died, giving a mortality of 8·31 per cent. on those treated to a termination.

The average daily number of beds occupied throughout the year was 867·57.

The time spent in hospital by each patient omitting the inmates of the Hospital for Incurables averaged nearly 21 days.

In the wards of the Cork-street, the Hardwicko, the Meath, and Dr. Stevens's Hospitals, 2,123 small-pox patients were received, of whom 479 died, giving a mortality of 22·56 per cent., which marks the severity of the epidemic. During the year 115 patients suffering from alcoholic poisoning, or affected with delirium tremens were under treatment in the above institutions.

In our last report we referred to the want of proper provision in most of these hospitals for the reception and treatment of patients labouring under these conditions. The inconveniences which attend the admission of cases of violent delirium to institutions in which there is no satisfactory means of separating them from other patients, and in which no regular arrangements exist for their nursing and restraint, are matters of daily experience; and we have more than once remarked to how great an extent the admission of such cases interferes with the comfort and welfare of the sick in general wards. We regret that the suggestions which we then made have not as yet been carried out by the hospital authorities, and consequently the defects complained of still exist.

In connexion with this subject we beg leave to point out a defect in the police arrangements, which sometimes leads to serious results, and not unfrequently imperils life. The difficulty of determining whether a person is suffering from alcoholism, narcotic poisoning, injury to the head, apoplexy, or other conditions involving the functions of the brain has frequently been demonstrated by cases coming under the cognizance of the police. It requires much experience and skill to recognise accurately such affections, and we venture to suggest to your Grace that cases in which doubt exists should at once be seen by a medical practitioner, to decide whether they should be removed to hospital or detained in the police station.

In the appendixes annexed are submitted a series of tabular statements, which show the statistics of each hospital in respect to income and expenditure, the number of patients treated and the results, together with the average cost per bed occupied in each hospital.

WESTMORLAND LOCK HOSPITAL.

On inspection we found order, neatness, and cleanliness visible in every part of the institution. Ventilation was good. The sewers were trapped and said to be effective, while various necessary internal improvements, such as painting, papering, &c. had been recently effected.

Nine hundred and twenty-five patients were treated in the

hospital during the year, 7 died, giving a mortality of '82 per cent., on the total number, 848 treated to a termination. Eight children were born in the institution during the past year. The average daily number of beds occupied was 67'87, and the time spent in hospital by each patient averaged 26'87 days.

We append some statistical tables, which specially relate to this institution for the last two years, arranged with the object of affording, in a condensed and convenient shape, some valuable and suggestive information.

STEEVENS'S HOSPITAL.

The domestic arrangements for promoting the comforts and well-being of the patients have recently received the most anxious attention of the Governors. Alterations will, however, be required to place this hospital in a perfectly satisfactory condition. Nos. 3, 4, 5, and 6 wards, are liable to contamination from the exhalations of the water-closets which open directly into the wards. We have recommended that these water-closets should be reconstructed outside the hospital walls, and approached from the wards by lobbies suitably lighted and ventilated.

The arrangements for baths and lavatories are also defective. Should a bath be required in the principal surgical wards in the south wing of the house, there being no hot water apparatus in connexion with it, water must be specially heated and carried to these wards to the annoyance and discomfort of the patients generally.

We were pleased to be informed that the nursing service is to be remodelled, and that a lady superintendent, trained in Saint Thomas's Hospital, London, is to be appointed. The assistant nurses are to be provided with dormitories separate from the wards. The head nurses will in future dine in an apartment provided for that purpose, instead of being supplied, as heretofore, with food to be cooked in their own apartments.

Improvements in respect to dietary and its distribution will also be carried out.

In connexion with the epidemic wards, we recommend that a chamber be allotted for stoving or purifying the clothes of fever patients, thus lessening the chances of contagion being spread when the patients return to their own homes. There were 159 cases in this institution at the commencement of the year; 2,138 were admitted; 2,117 discharged; 55 died, and 125 remained on the 31st March, 1879.

The mortality was 2'53 on the total number treated to a termination.

The time spent in hospital by each patient, averaged 20'75 days, and the average daily number of beds occupied during the year was 130'58.

MEATH HOSPITAL AND COUNTY DUBLIN INFIRMARY.

We carefully examined the several departments of this institution and found the buildings in good order and the sewers trapped and ventilated.

In a previous report it was stated that alterations were necessary with regard to the water-closets, and it is to be hoped that these changes will soon be effected.

Though the position of the wards on either side of a central passage is a plan long since condemned, the ventilation is as perfect as the building will admit of.

The patients are well cared, the changes of linen sufficient, and the food was of good quality and properly cooked. A lady superintendent and an assistant matron have charge of the nursing, and the dietary and cleansing of the hospital, all details of which appear to be efficiently carried out. We have been informed that the antiquated wooden bedsteads are to be replaced by those of an improved pattern, and that a new supply of hair mattresses is to be provided.

The soiled clothes from the epidemic wards are disinfected and washed separately from the other linen of the hospital.

The recreation grounds, in which the convalescent patients are permitted to take exercise, are neatly kept, and present a cheerful appearance.

During the past year 1,429 patients were admitted into the wards of this institution, exclusive of 104 who remained therein on the 1st of April, 1878, making a total of 1,533 treated; of this number 1,442 were discharged cured or relieved; 87 died during the year, giving a mortality of 6·03 per cent. on the total number treated to a termination.

The average daily number of beds occupied throughout the year was 97·02, and the time spent in hospital by each patient averaged 23·10 days.

CORK-STREET FEVER HOSPITAL.

This hospital continues in an efficient condition, and the patients receive every care and attention.

On the 1st April, 1878, 135 patients remained in the institution; 2,151 were admitted, being an increase of 1,215 on the previous year, due principally to the epidemic of small-pox; 1,764 patients were discharged, 447 died, and 75 remained at the close of the year.

The time spent in hospital by each patient averaged 18·30 days.

The average daily number of beds occupied throughout the year was 114·67. The highest numbers were in January and February, the lowest in October and November.

One thousand five hundred and nine small-pox patients were admitted during the past year, and the grave character of those cases treated is indicated by the high rate of mortality which reached an average of 23 per cent. compared with 9·49 per cent. the preceding year.

Should the epidemic continue in its present extended form we

are of opinion that a larger portion of the hospital might with advantage be allotted to such cases, by which arrangement the wards could be systematically emptied in rotation for thorough purification and exposure to air and sunlight, thus obviating the danger to overcrowding and to the gradual contamination of the building.

The managing committee were enabled to destroy the infected clothes by the aid of the Dublin Corporation, who, in addition to their annual grant to the hospital, voted a sum as compensation for the clothes so destroyed.

Dr. J. W. Moore's valuable and instructive medical report records the localities which were haunted by disease, and which furnished cases to the hospital.

HOUSE OF INDUSTRY HOSPITALS.

On inspection we found that general order and neatness prevailed throughout this institution. The wards were scrupulously clean and the floors well scrubbed; the bedsteads and bedding together with the bed-linen were good and clean. There was a sufficient supply to each ward of foot-warmers, cross-shoots and rubber-sheets. The appliances for washing the sick are well arranged and supplied.

The prescription and diet cards were properly filled up and kept over each bed, by which means accurate and immediate information is obtainable of the particulars of each case under treatment.

The various foods and drinks for the patients we tasted and found, without exception, good and well prepared.

We have been informed that the Governors intend to effect improvements in the Richmond Hospital, which will to a great extent counteract the defective construction of the building, but we were sorry to learn that owing to the present want of accommodation, patients suffering from delirium tremens are still admitted to the Hardwicke Hospital and treated in the same wards with fever patients, an arrangement which should not exist, in this otherwise admirably managed institution.

HARDWICKE FEVER HOSPITAL.

On the 1st April, 1878, there remained in the hospital 71 patients; 1,275 were admitted in the course of the year; 1,078 were discharged, and 228 died, giving a mortality of 17·45 per cent.

The average daily number of beds occupied throughout the year was 63·48; and the time spent in hospital by each patient averaged 17·21 days.

Of the admissions 491 were small-pox cases, of which (423 were vaccinated) 102 died, or 20·77 per cent.; the highest numbers in hospital were in December and January, the lowest in August and September.

WHITWORTH HOSPITAL.

Seventy-two patients remained on the 1st April, 1878; 852 were admitted during the year; 765 were discharged, and 93 died, in the year ended 31st March, 1879.

The daily average number of beds occupied throughout the year was 61, and the time spent in hospital by each patient averaged 24 days.

The mortality on the total number treated to a termination was 10·83.

RICHMOND HOSPITAL.

Eighty-four patients remained on the 1st April, 1878, 1,056 were admitted during the year; 999 discharged, and 41 died, giving a mortality of 3·94 per cent. on 1,040 surgical cases treated to a termination.

The average daily number of beds occupied throughout the year was 86·51, and the time spent in hospital by each patient averaged 27·7 days.

ROTUNDA LYING-IN HOSPITAL.

This hospital has not failed in any particular to maintain its high reputation for promoting education. The most rigid attention is given to details in regard to cleanliness and order. We are, however, of opinion that, if measures were taken to carry off the injurious products of combustion from gas lights, as recommended in our last Report, ward ventilation might be much improved.

As blankets and other woollen fabrics are likely to become saturated with the exhalations from lying-in patients, it might be desirable, as a precautionary measure against disease to have such blankets invariably washed or purified after once using. It would also be well to air, and, occasionally to clean and disinfect the pillows, both hair and feather.

The financial condition of the charity enabled the Governors to erect a new mortuary in place of that so long in use to the insufficiency of which on a previous occasion we called attention.

On the 1st April, 1878, there were 28 patients in the labour wards; 1,375 were admitted during the year; of these 1,091 were discharged after delivery; 265 were discharged not being in labour; and 17 died, being at the rate of 1·53 per cent.; 30 patients remained in the wards at the close of the year.

In the auxiliary hospital 24 women affected with chronic diseases were present at the commencement of the year; 368 were admitted, 362 discharged, and 10 died, giving a mortality of 2·68 per cent.

The average number of beds occupied by chronic patients was 23, and by labour cases 28·30, and the stay of the latter in hospital averaged 7·36 days, while the former averaged 21·41 days.

COOMBE LYING-IN HOSPITAL.

This institution which has within the last few years been re-erected through the munificence of Sir A. Guinness, Bart., M.P., is now in a condition to afford relief to a large number of intern patients. On inspection we found it clean, well ventilated, and in good order.

We observed that a special ward on each floor is allotted to patients in actual labour, an arrangement which appears desirable, as the cries and groans of such patients must distress and alarm other women awaiting their hour of trial. A lift has also been constructed for the use of patients.

The average cost per bed in the gross comes to £94 13s. 11½d., exclusive of buildings and furnishing such buildings. On several occasions we have adverted to the comparative high expenditure in this hospital, and we have again requested the managing committee's consideration to the subject.

We have been informed that recently some changes have been made which will lessen the expenditure without detracting from the efficiency of the institution. The office of registrar and apothecary, at a salary of £60 per annum, has been discontinued.

An apothecary has been appointed at a salary of £20 per annum, to attend daily two hours to compound medicine.

One female servant has been dismissed, and the vacancy will not be filled up unless absolutely necessary; the saving thus effected will amount to £60 or £70 per annum.

Seven labour cases remained in hospital on the 1st April, 1878; 550 were admitted; 551 discharged; 1 died in the year ended 31st March, 1879, and 5 then remained.

Seventeen patients affected with chronic diseases remained on the 1st April, 1878; 94 were admitted, 86 discharged; 4 died, and 21 remained at the end of the year.

The mortality of the patients admitted to the labour wards, deducting 52 that were discharged not in labour, was one death in 500 cases; that of the chronic class was 444 per cent.

HOSPITAL FOR INCURABLES.

The patients appeared grateful and cheerful, considering their sad circumstances. Their personal cleanliness as regards hair, skin, and linen were better attended to than is often seen. We may add that everything that skill and kindness can effect is provided for the alleviation of their sufferings.

Considerable improvements have recently been made, including the erection of a handsome porch at the entrance door to prevent draughts. The grounds have been drained, and as a precaution against fire a Vartry main has been laid, at considerable expense, to both front and rear of the hospital.

At the commencement of the year 147 patients remained in the institution; 57 were admitted; 8 discharged; 35 died, and 161 remained on the 31st March, 1879.

The average daily number of beds occupied was 154, and the time spent in hospital by each patient averaged 275½ days.

ST. MARK'S OPHTHALMIC HOSPITAL.

This hospital is conducted with great efficiency, and the patients are well cared.

Since our previous visit the principal wards have been renovated and enlarged, and a spacious dispensary formed in the western side of the house.

With a view to the improvement of the sanitary condition of the institution the sewers have been entirely reconstructed, trapped, and carried outside the building. The new water-closets, baths, lavatories, and other material arrangements merited our approval.

We have been informed that the Governors will soon be in a position to open a ward for the treatment of contagious ophthalmia.

This institution is at present one of the most perfect of its kind in the country.

On the 1st April, 1878, 29 patients were in hospital; 333 were admitted during the year; 342 were discharged, and 20 then remained.

The average daily number of beds occupied was 20, and the time spent in hospital by each patient averaged 20.18 days.

The registry of the patients is kept with strict accuracy.
